一、Overview

1.1 Verification scope

This outline is mainly compiled with reference to relevant Chinese standards, RFC standards, relevant recommendations of the International Telecommunication Union ITU-T, as well as the "Guidance on Optimization and Reconstruction of China Telecom's Metropolitan Area Network" and "Technical Specifications for China Telecom's Metropolitan Area Network Equipment".

1.2 Reference Standards

The following standards contain clauses that constitute the clauses of this standard through reference in this standard. When the standard is published, the versions shown are valid. All standards will be revised, and the parties using this standard should explore the possibility of using the latest versions of the following standards.

IEEE802.1d	Media Access Control (MAC) Bridge
IEEE802.1q	Virtual Bridged LAN
IEEE802.1ad	Supplier Bridging
IEEE802.1ag	Ethernet Link Fault Management
IEEE802.1ah	Provider Backbone Bridging
IEEE802.3	LAN protocol standards
IEEE802.3ad	Multi-link segment aggregation
IEEE802.3ah	Ethernet in the First Mile
ITU Y.1731	Ethernet OAM and Performance Management
RFC826	Ethernet Address Resolution Protocol ARP
RFC1213	Management Information Base (MIB-II)
RFC1256	ICMP Router Discovery Messages
RFC1643	Definition of managed objects for Ethernet interface types
RFC1901	SNMPv2
RFC1902	SMI for SNMPv2

RFC1905	SNMPv2 Protocol Operation
RFC1907	MIB for SNMPv2
RFC2233	Using the SMIv2 interface group MIB
RFC2236	Internet Group Management Protocol (IGMP) version 2

1.3 Abbreviations

ACL	Access Control List
ANSI	National Institute of Standards
ARP	Address Resolution Protocol
FCS	Frame Check Sequence
FIB	Forwarding Information Table
GE	Gigabit Ethernet
ICMP	Internet Message Protocol
IGMP	Internet Group Message Protocol
IP	Internet Protocol
IPv4	Internet Protocol – Version 4
LAN	local area network
MIB	Management Information Base
MTU	Maximum Transmission Unit
OA & M	Operation management and maintenance
PDU	Protocol Data Unit
PPP	Point-to-Point Protocol
RADIUS	Remote Authentication Dial-up User Service

SNMP	Simple Network Management Protocol
SVLAN	Stack VLAN
TCP	Transmission Control Protocol
TOS	Service Type
TTL	Survival time
UDP	User Datagram Protocol
VLAN	Virtual Local Area Network
WAN	Wide Area Network

1.4 Introduction to the whole system design

The N9200-64DC is a spine switch for high-performance data centers. The switch provides line-rate L2 and L3 switching across the 64 x QSFP56-DD ports, each supporting 1 x 400G QSFP56-DD, 1 x 100G QSFP28, 1 x 40G QSFP+, or via breakout cables 2 x 200G (2 x 4 lanes 50G PAM4), 4 x 100G (4 x 2 lanes 50G PAM4), 2 x 50G (2 x 2 lanes 25G NRZ), 4 x 25G NRZ, or 4 x 10G NRZ. The N9200-64DC can be deployed as a spine switch supporting 100/400 GbE spine to spine or spine to leaf interconnects. This open network switch is loaded with the Open Network Install Environment (ONIE), which supports the installation of compatible Network Operating System software, including the open source options Open Network Linux, plus commercial NOS offerings.

1.5 Key Features and Benefits

- QSFP56-DD switch ports, each supporting 1 x 400G QSFP56-DD, 1 x 100G QSFP28, 1 x 40G QSFP+, or via breakout cables 2 x 200G (2 x 4 lanes 50G PAM4), 4 x 100G (4 x 2 lanes 50G PAM4), 2 x 50G (2 x 2 lanes 25G NRZ), 4 x 25G NRZ, or 4 x 10G NRZ.
- Incorporates Broadcom Tomahawk 4 switch series silicon.
- 2 RU form factor.
- Supports hot/cold aisles with front-to-back airflow SKU.
- All ports on front; PSUs and fans accessible from rear.
- Hot-swappable, load-sharing, redundant 2400 W AC/HVDC PSUs.
- 3+1 redundant, hot-swappable fan modules.

- Hardware switch pre-loaded with Open Network Install Environment (ONIE) for automated loading of compatible open source and commercial NOS offerings.
- Compatible with Open Network Linux (ONL), the open-source, OCP reference NOS.

二、Verification Plan

2.1 Verify the environment

The switch test environment consists of the device under test, instruments, servers, routers and configuration terminals. Most test items are performed between the device under test and the instruments. The server is used to detect the support of the device under test for functions such as RADIUS and SYSLOG. For specific test items, there are also detailed test environments. For the topology diagram, please refer to each test item.

2.2 Verification Tools and Instruments

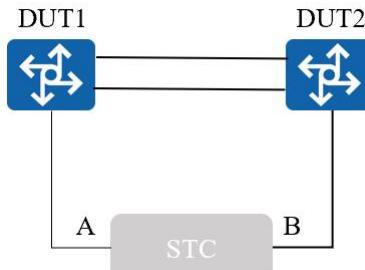

Tester : Spirent TestCenter , supports 100G tester port .

PC : 1, pre-installed with Windows 10 operating system

- tacacs software: tacacs .net
- Logging software: tftpd64
- MIB query software: netsnmp

三、 L2

3.1 PASS - Link Aggregation 802.3 ad

Test items	Link aggregation function test
Test content	Verify that the DUT implements 802.3ad link aggregation functionality
Test topology	
Test steps	<ol style="list-style-type: none"> 1. Connect the equipment according to the test environment; 2. The ports connected between DUT1 and DUT 2 are set to be aggregated in one group; 3. The test instrument port A sends a broadcast to port B (MAC ground is all "F") ; 4. Disconnect one of the links; 5. The test instrument port A sends N unicast streams to port B (N is greater than the number of aggregated links) ; 6. Disconnect one of the links 7. The test instrument port A sends two unicast data streams with the same priority to port B. The flow rate of data stream 1 is greater than the line rate of the aggregation port, and the flow rate of data stream 2 is less than the line rate of the aggregation port.
Expected Results	<ol style="list-style-type: none"> 1. In steps 4 and 6, the test instrument port B should be able to receive the data packet sent by port A 2. In step 7, the test instrument port B should be able to receive the two data streams sent by port A

5.6 PASS - PFC (Priority Flow Control)

Test items	PFC Function Test
Test content	Test device PFC can trigger PFC messages and stop according to PFC priority
Test topology	<pre> graph LR DUT1[DUT1] --- 1[1] DUT1 --- 2[2] DUT1 --- C[C] 1 --- A[A] 2 --- B[B] C --- STC[STC] style DUT1 fill:#0070C0,stroke:#000,stroke-width:2px style STC fill:#D9E1F2,stroke:#000,stroke-width:2px </pre>
Test steps	<ol style="list-style-type: none"> Set up the test environment according to the diagram. Configure dot1p priority 3 to map to tc3 and pg3 Bind qos mapping to port Enable PFC priority 3 on DUTP1 and DUTP2 Create VLAN 100 and add DUT P1-P3 to VLAN 100 as tagged members TGB and TGC send bidirectional VLAN tagged data streams, and the packet sending rate of TGC is 100% to TGB TGA sends VLAN 100 , priority 3 data packets to TGB at line speed TGA capture shows the PFC priority 3 packets sent by the device. Stop all outbound packets Create pfc -priority-queue and set pfc priority 3 to correspond to queue3 Bind the created pfc -priority-queue to TGB TGA sends VLAN 100 , priority 3 data packets to TGB at line speed TGB sends PFC priority 3 messages Delete related configuration
Expected Results	<p>2-6 Configuration successful 8. PFC priority 3 message sent by the device 100 priority 3 packets from TGA</p>
DUT CONFIGURATION	<p>Configuring QOS</p> <pre> config qos dot1p-tc add dot1p_to_tc_profile --dot1p 3 --tc 3 config interface qos dot1p-tc bind Ethernet0 dot1p_to_tc_profile config interface qos dot1p-tc bind Ethernet8 dot1p_to_tc_profile config interface qos dot1p-tc bind Ethernet16 dot1p_to_tc_profile config qos tc-pg add tc-pg-prof --tc 3 --pg 3 config interface qos tc-pg bind Ethernet0 tc-pg-prof config interface qos tc-pg bind Ethernet8 tc-pg-prof config interface qos tc-pg bind Ethernet16 tc-pg-prof config qos tc-queue add tc-queue-prof --tc 3 --queue 3 config interface qos tc-queue bind Ethernet0 tc-queue-prof config interface qos tc-queue bind Ethernet8 tc-queue-prof config interface qos tc -queue bind Ethernet 16 tc -queue-prof </pre>

Enable PFC priority 3 on the port
 config interface pfc priority Ethernet 0 3 on
 config interface pfc priority Ethernet 8 3 on

```
root@sonic:/home/admin# config interface pfc priority Ethernet0 3 on
Interface      Lossless priorities
----- 3
Ethernet0
root@sonic:/home/admin# config interface pfc priority Ethernet8 3 on
Interface      Lossless priorities
----- 3
Ethernet8
root@sonic:/home/admin#
```

Configuring VLANs

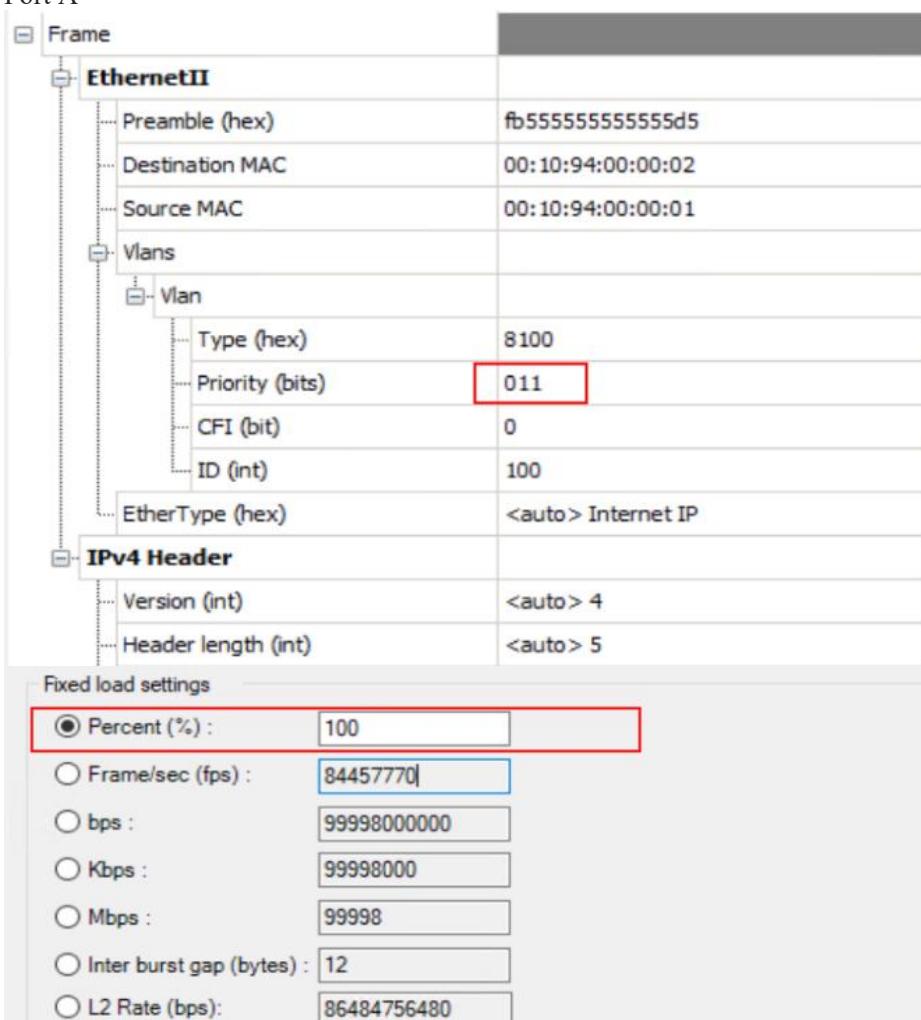

```
config vlan add 100
config vlan member add 100 Ethernet 0
config vlan member add 100 Ethernet 8
config vlan member add 100 Ethernet 16
```

TGB and TGC send bidirectional VLAN tagged data streams, and the packet sending rate of TGC is 100% to TGB

TGA sends VLAN 100 , priority 3 data packets to TGB at line speed

TGA capture shows the PFC priority 3 packets sent by the device.

Configuring pfc -priority-queue

```

config qos pfc -priority-queue add pfc_queue_profile -- pfc -priority 3 --queue 3
config interface qos pfc -priority-queue bind Ethernet 8 pfc_queue_profile
  
```

Stop sending packets on all ports

TGA sends VLAN 100 , priority 3 data packets to TGB at line speed

TGB sends the destination learning packet and the PFC priority 3 message

Remark																																																																																																							

5.8 PASS - PFC Watchdog (WD)

Test items	PFC Watchdog function test
Test content	Test equipment PFC watchdog can work

Test topology	<p>The diagram illustrates the test topology. At the top is a blue square labeled "DUT1" containing a white double-headed arrow icon. Below it is a grey rounded rectangle labeled "STC". Two horizontal lines, labeled "A" and "B", connect the "DUT1" square to the "STC" rectangle. A vertical line, labeled "C", connects the "DUT1" square to the "STC" rectangle.</p>
Test steps	<ol style="list-style-type: none"> 1. Set up the test environment according to the diagram. 2. Configure dot1p priority 3 to map to tc3 and pg3 3. Bind qos mapping to port 4. Enable PFC priority 3 on DUTP1 and DUTP2 5. Create VLAN 100 and add DUT P1-P3 to VLAN 100 as tagged members 6. Create pfc -priority-queue and set pfc priority 3 to correspond to queue3 7. Bind the created pfc -priority-queue to TGB 8. TGA sends VLAN 100 , priority 3 data packets to TGB at line speed 9. TGB sends a message with PFC priority 3. 10. Port Enable PFCWD Delete related configuration
Expected Results	<ol style="list-style-type: none"> 8. TGB stops receiving TGA data messages 9. TGB starts to receive some TGA data messages
DUT Configuration	<p>Configuring QOS</p> <pre> config qos dot1p-tc add dot1p_to_tc_profile --dot1p 3 --tc 3 config interface qos dot1p-tc bind Ethernet0 dot1p_to_tc_profile config interface qos dot1p-tc bind Ethernet8 dot1p_to_tc_profile config interface qos dot1p-tc bind Ethernet16 dot1p_to_tc_profile config qos tc-pg add tc-pg-prof --tc 3 --pg 3 config interface qos tc-pg bind Ethernet0 tc-pg-prof config interface qos tc-pg bind Ethernet8 tc-pg-prof config interface qos tc-pg bind Ethernet16 tc-pg-prof config qos tc-queue add tc-queue-prof --tc 3 --queue 3 config interface qos tc-queue bind Ethernet0 tc-queue-prof config interface qos tc-queue bind Ethernet8 tc-queue-prof config interface qos tc-queue bind Ethernet16 tc-queue-prof </pre> <p>PFC priority 3 is enabled on the port</p> <pre> config interface pfc priority Ethernet0 3 on config interface pfc priority Ethernet8 3 on </pre>

```
root@sonic:/home/admin# config interface pfc priority Ethernet0 3 on
Interface      Lossless priorities
-----
Ethernet0                  3
root@sonic:/home/admin# config interface pfc priority Ethernet8 3 on
Interface      Lossless priorities
-----
Ethernet8                  3
root@sonic:/home/admin#
```

Configuring VLANs

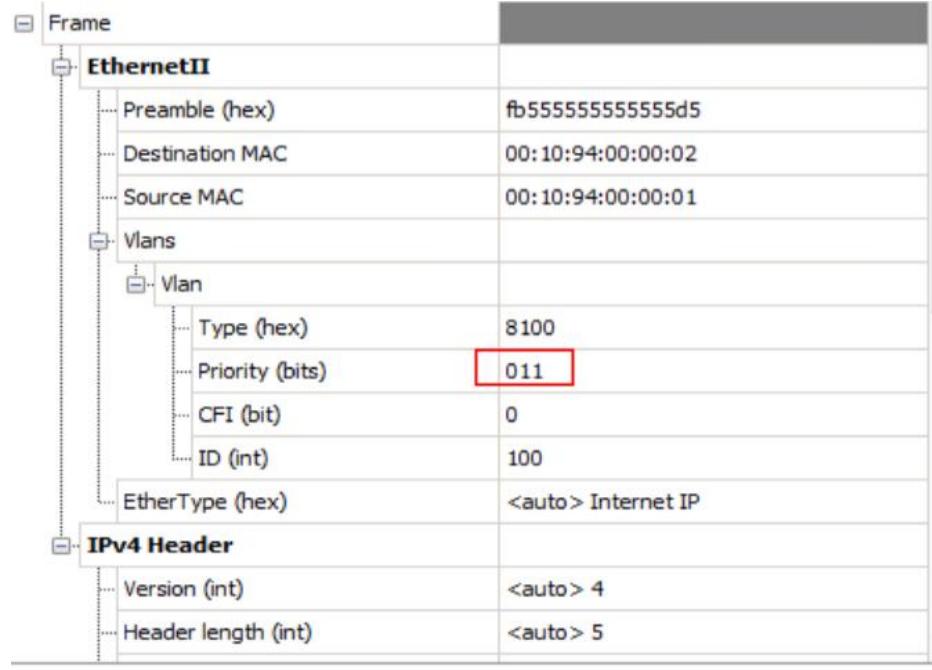

```
config vlan add 100
config vlan member add 100 Ethernet0
config vlan member add 100 Ethernet8
config vlan member add 100 Ethernet16
```

Configuring pfc-priority-queue

```
config qos pfc -priority-queue add pfc_queue_profile -- pfc -priority 3 --queue 3
config interface qos pfc -priority-queue bind Ethernet 8 pfc_queue_profile
```

TGA sends VLAN 100 , priority 3 data packets to TGB at line speed

TGB sends the destination learning packet and the PFC priority 3 message

5.9 PASS- PFC Watermark (WM)

Test items	PFC Watetmark Functional Test
Test content	Test equipment PFC Watermarks can be displayed as statistics.
Test topology	<p>The diagram illustrates a test topology. At the top, there is a blue rectangular block labeled "DUT1" with the text "DUT" written below it. Two lines extend downwards from the top of this block, each ending in a small blue rectangle. The left line is labeled "A" at its bottom end, and the right line is labeled "B" at its bottom end. This represents a connection between the DUT and two external ports or cables.</p>

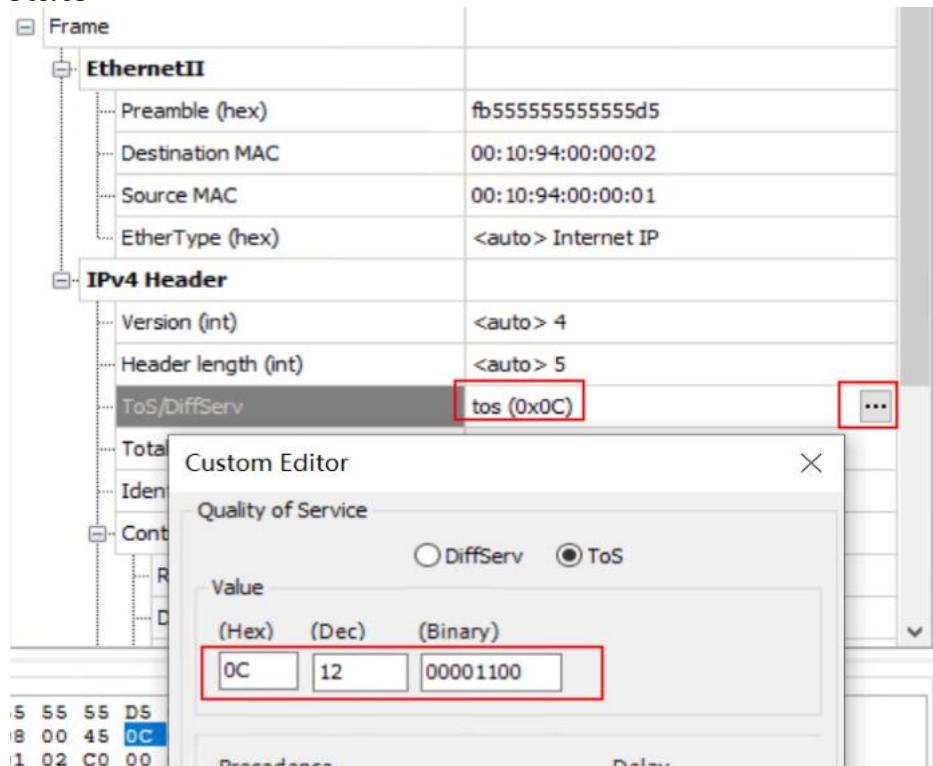

Test steps	<ol style="list-style-type: none"> 1. Set up the test environment according to the diagram. 2. Load qos configuration file 3. Configure buffer parameters and bind to the port 4. Configure dscp3 to map to tc 3 , mapped to pg 3 ; dscp 0 to map to tc 0 , mapped to pg 0 5. Bind qos mapping to port 6. Create pfc -priority-queue to set pfc priority 3 to queue 3 and pfc priority 0 to queue 0 7. Bind the created pfc -priority-queue to the port 8. Enable PFC priority 3,0 on the port 9. Create VLAN 100 and add ports to VLAN 100 10. 1 230 length data packets of dscp 3 and dscp 0 to TGB at line speed 11. View watermark statistics 12. TG B egress speed limit 1 0 G 13. View watermark statistics 14. Delete related configuration
Expected Results	<p>2 - 9 Configuration successful 11.1 3. View statistics</p>

The screenshot shows the NADDOD software interface for configuring network traffic streams. The main window displays the structure of an Ethernet II frame with its various fields like Destination MAC, Source MAC, EtherType, and IPv4 Header. Below the frame structure, there's a section for 'Fixed load settings' where the 'Percent (%)' option is selected and set to 100. The 'Frame/sec (fps)' option is also present with a value of 84457770. At the bottom, a specific stream is selected named 'StreamBlock 36'. This stream's configuration includes a fixed frame size of 1230 bytes, an active status, and a load mode set to 'Fixed' with a percent value of 10. There are also options for incrementing or decrementing the frame size.

TGA sets the line speed to send DSCP3 packets with a length of 1230 to TGB, and checks the packet receiving rate.
Port A

The screenshot shows a software interface for configuring network traffic. On the left, a tree view displays the frame structure:

- Frame
- EthernetII
 - Preamble (hex): fb5555555555d5
 - Destination MAC: 00:10:94:00:00:02
 - Source MAC: 00:10:94:00:00:01
 - EtherType (hex): <auto> Internet IP
- IPv4 Header
 - Version (int): <auto> 4
 - Header length (int): <auto> 5
 - ToS/DiffServ
 - Tos (0x0C)
- Total Length (int): 5555D500
- Identification (int): 00450C00
- Flags
 - Reassembly: 01
 - Dont Fragment: 00

Below the tree view, the raw hex dump of the frame is shown:

5	55	55	D5	0
8	00	45	0C	0
1	02	C0	00	0

A red box highlights the ToS field in the IPv4 header. A modal window titled "Custom Editor" is open over the "Quality of Service" section:

5.13 PASS -WRED

Test items	WRED Function Test
Purpose of the test	The test equipment can forward messages according to the wred settings.

Test environment	<p>The diagram illustrates the test setup. At the top, a blue rectangular box labeled "DUT1" contains the text "DUT". Two horizontal lines extend downwards from the DUT, labeled "1" and "2" at their top ends. The line labeled "1" connects to a grey rectangular box labeled "TGA" at its bottom end, which is labeled "A" at its left side. The line labeled "2" connects to a grey rectangular box labeled "TGB" at its bottom end, which is labeled "B" at its left side.</p>
Test steps	<ol style="list-style-type: none"> 1. Set up the test environment according to the diagram. 2. Configuring Two WRED Profiles 3. Bind the WRED profile to the outbound ports Queue 0 and Queue 3 respectively. 4. Configure the QOS profile and bind it to the port, set DSCP 0 to Queue 0 and DSCP 3 to Queue 3 5. Configure the egress rate limit to 10G 6. Create VLAN 100 and add DUT P1 and DUTP2 to VLAN 100 as untagged members. 7. TGB continues to send mac learning packages 8. TGA sends messages to TGB at line speed Continue for 10 seconds to check the packet loss ratio received by TGB 9. Delete the wred configuration and repeat step 8 to view the packets received by TGB.
Expected Results	<p>8. wred works as configured 9. No wred behavior</p>

This screenshot shows a software interface for configuring network frames. It displays the structure of an Ethernet II frame with its header fields and their values. The IPv4 header section is expanded, showing the Version, Header length, and ToS/DiffServ fields. The ToS field is highlighted with a red box and set to 'tos (0x0C)'. Below this, a 'Custom Editor' window is open for the ToS field, showing the value in Hex (0C), Dec (12), and Binary (00001100). The 'Quality of Service' tab is selected in this editor. At the bottom, there are tabs for General, Frame, Groups, Rx Port, and Preview, with 'Frame' currently selected. A checkbox for 'Active' is checked, and the name 'StreamBlock 42' is entered. A section for 'Frame size (Bytes)(With CRC and signature field)' is present, with 'Fixed' selected and a size of 1230. Other options like 'Increment', 'Decrement', and 'Random' are available with their respective parameters.

Test content	Test the impact of hot restart on the data plane
Test topology	
Test steps	<pre>w arm-reboot -v</pre> <ol style="list-style-type: none"> 1. Add PORT1 and PORT2 to VLAN 100 , config save 2. Instrument setting 1 000000/ pps 3. Execute w arm-reboot -v 4. Observe the number of packet losses after warm -reboot is completed and calculate the impact time
Expected Results	Record impact time
DUT Configuration	<pre>V lan configuration config vlan add 100 config vlan member add 100 Ethernet 0 -u config vlan member add 100 Ethernet 8 -u config save</pre> Port A

Test Results	PASS
Remark	

6.10 PASS - AAA

Test items	AAA
Purpose of the test	The test equipment can be operated normally
Test topology	 <pre> graph LR PC1[PC1] --- DUT[DUT] </pre>
Test steps	<ol style="list-style-type: none"> 1. Set up the test environment according to the diagram. 2. Configure the device tacacs Server to PC 3. Configure AAA authentication tacacs 4. After connecting to the device using ssh, user tacadmin can operate the device 5. Configure the authorization method to tacacs , and the tacadmin user's operations are restricted
Expected Results	<p>2. 3. Configuration successful 4 . aaa works fine</p>
DUT Configuration	<p>Configure tacacs config tacacs add 172.21.110.110 -k accton</p> <p>Configure aaa authentication to tacacs config aaa authentication login tacacs + local</p> <p>Use ssh to connect to the device management interface, username tacadmin Password: tacadmin</p>

Remark

6.11 PASS - ZTP

Test items	ZTP
Purpose of the test	Test switch support for ZTP
Test topology	 <pre> graph LR PC1[PC1] --- DUT[DUT] </pre>
Test steps	<ol style="list-style-type: none"> 1. Export the current configdb file (the exported one can be ignored), delete the current configdb file 2. PC1 opens dhcp server configuration option67, opens tftp server including ztp configuration file, opens http server including configdb 3. Restart the DUT and check whether the ztp configuration and configdb are obtained
Expected Results	<ol style="list-style-type: none"> 2. You can get the ztp configuration and configdb files
DUT Configuration	<p>Default configuration: Enabled</p> <pre>root@sonic :/home/admin# cat /host/ ztp / ztp_cfg.json { "admin -mode": true, "ztp - json - local " : "/mnt/usb/ztp.json " }</pre> <p>Delete the configdb file</p> <pre>rm/ etc /sonic/ config_db.json</pre> <p>Device restart</p> <pre> sonic login: Dec 30 11:39:08.293770 sonic INFO sonic-ztp[2216]: ZTP service started Dec 30 11:39:08.297654 sonic INFO sonic-ztp[2216]: Checking running configuration to load ZTP configuration profile.
